

Textile Organics

Matter in various forms that contain carbon atoms form the basis of organic chemicals. These may include simple organic acids and alkalis to complex macro molecules. Both physical properties and chemical properties are characteristics of an organic compound. Its uses mainly depend on its chemical reactivity to various substrates. The uniqueness of organic compounds is seen when it is compounded with various formulations, organometallic materials and inorganic materials to deliver novel functional properties. The art of making an organic formulation and reaction forms the basis of textile chemicals and they are cost effective.
